## Chapter 2

## ■ Agenda

- Basic definitions
- Properties of Boolean Algebra
- Boolean Functions
- Canonical and standard Forms

## ■ Reading

- Mano: Ch 2

## ■ Objectives

- Understanding the canonical forms
- Maxterms and minterms
- Simplifying Boolean expression and functions

# Boolean Algebra

- The mathematical system that operate with binary values (George Boole (1854) )
- Is the algebraic structure defined on a set of elements with two binary operators + (OR) and  $\cdot$  (AND) provided that the following Huntington postulates are satisfied:
- Reading :  
Mano Chapter 2

# Huntington Postulates

- closures w.r.t operator  $+$
  - closures w.r.t operator  $.$
- An identity element w.r.t  $+$  ( $0$ ):  $x + 0 = 0 + x = x$
  - An identity element w.r.t  $.$  ( $1$ ):  $x . 1 = 1 . x = x$
- Commutative w.r.t  $+$ :  $x + y = y + x$
  - Commutative w.r.t  $.$ :  $x . y = y . x$
- $.$  is distributive over  $+$ :  $x . (y + z) = (x . y) + (x . z)$
  - $+$  is distributive over  $.$ :  $x + (y . z) = (x + y) . (x + z)$
- The complement of  $x$  is such that
  - $x + x' = 1$  and
  - $x . x' = 0$
- There exist at least 2 elements  $x, y$  such that  $x \neq y$

# Two-Valued Boolean Algebra

- Is defined on a set of 2 elements,  $B = \{0,1\}$  with rules for the two binary operators  $+$  and  $\cdot$  as shown in the following tables:
- These rules are exactly the same as the AND, OR, and Not operations.

$X$	$Y$	$X \cdot Y$
0	0	0
0	1	0
1	0	0
1	1	1

$X$	$Y$	$X + Y$
0	0	0
0	1	1
1	0	1
1	1	1

$X$	$X'$
0	1
1	0

# Huntington Postulates on the Two-Valued Set and the two Binary Operators

1. closure is obvious from the tables as the result of each operation is either 0 or 1
2. (a) An identity element w.r.t  $+$  (0):  $0 + 0 = 0, 0 + 1 = 1 + 0 = 1$   
(b) An identity element w.r.t  $\cdot$  (1):  $1 \cdot 1 = 1, 1 \cdot 0 = 0 \cdot 1 = 0$
3. The Commutative laws are obvious
4. (a) the distributive law :  $x \cdot (y + z) = (x \cdot y) + (x \cdot z)$  can be verified by the truth table of all possible values of  $x, y$  and  $z$   
(b) the distributive law:  $x + (y \cdot z) = (x + y) \cdot (x + z)$  can also be verified by the truth table of all possible values of  $x, y$  and  $z$
5. The complement of  $x$  (a)  $x + x' = 1$ :  $0 + 0' = 0 + 1 = 1$  and  $1 + 1' = 1 + 0 = 1$   
(b)  $x \cdot x' = 0$ :  $0 \cdot 0' = 0 \cdot 1 = 0$  and  $1 \cdot 1' = 1 \cdot 0 = 0$
6. The two valued Boolean algebra has two distinct elements 1 and 0 with  $1 \neq 0$

# Property of Boolean Algebra 1

## ■ Closure

- Obtaining a unique elements (which are the members of Boolean set)

## ■ Associative Law

- $(X*Y)*Z = X*(Y*Z)$
- $(X+Y)+Z = X+(Y+Z)$

## ■ Commutative Law

- $X*Y = Y*X$
- $X+Y = Y+X$

# Property of Boolean Algebra 2

- Identity Element

- $1.X=X.1=X$
- $0+X=X+0=X$

- Inverse

- $X.X' = 0$
- $X+X' = 1$

- Distributive Law

$$X+(Y.Z)=(X+Y).(X+Z)$$

# Basic Theorems

## ■ Duality

- Huntington (1904) postulate that of an algebraic expression, we can simply interchange OR and AND operator and replace 1 by 0 and 0 by 1
- [*We will discuss this more in future sessions when you enter the realm of digital design*]

# Algebraic Manipulation

- Simplify the following Boolean function to a minimum number of literals:

$$(1) F(x, y) = x(x' + y)$$

$$(2) F(x, y) = x + x'y$$

$$(3) F(x, y) = (x + y)(x + y')$$

$$(4) F(x, y, z) = xy + x'z + yz$$

$$(5) F(x, y, z) = (x + y)(x' + z)(y + z)$$

- *Solution:*

$$(1) F(x, y) = xx' + xy = 0 + xy = xy$$

$$(2) F(x, y) = (x + x')(x + y) = 1.(x + y) = x + y$$

$$(3) F(x, y) = x + yy' = x + 0 = x$$

or

$$= x + xy' + yx + yy' = x(1 + y' + y) = x.1 = x$$

$$(4) F(x, y, z) = xy + x'z + yz(x + x') = xy + x'z + xyz + x'y$$

$$= xy(1 + z) + x'z(1 + y) = xy + x'z$$

$$(5) (x + y)(x' + z)(y + z) = (x + y)(x' + z) \text{ by duality from 4}$$

# Complement of a Function

- De Morgan

- $(X+Y)' = X'.Y'$

- $(A+B+C)'$

- $= (A+X)'$  with  $X=B+C$

- $= A'X'$  (De Morgan)

- $= A'.(B+C)'$

- $= A'.(B'C')$  (De Morgan)

- $= A'.B'.C'$  (Associative)

# Complement of a Function

- Example:

Find the complement of the functions:

(1)  $F=A+B+C$ .

(2)  $F1=x' y z' + x' y' z$

(3)  $F2= x (y' z' +y z)$

- Solution:

(1)  $F'=(A+B+C)'=A'B'C'$

(2)  $F1'=(x' y z' + x' y' z)' = (x' y z')' (x' y' z)'$   
 $= (x + y' + z) (x + y + z')$

(3)  $F2'=x' + (y + z) (y' + z')$

# Canonical Forms

- Binary Variable can either be:
  - Normal Form ( $x$ )
  - Complement Form ( $x'$ )
  - For 3 binary variables ( $x, y, z$ ) there are 8 possibility of response for AND operation (minterms) and 8 possibility of OR operation (maxterms)

# Minterms #1

- “Minterms” or “Standard Product”
- 2 Binary Variable (X & Y) will form  $2^{n=2}$  Minterms
  - $X'Y'$ ,  $X'Y$ ,  $XY'$ ,  $XY$
  - AND Terms (“product”)
- Any Boolean function can be expressed as a sum of Minterms

# Conversion between canonical forms

$$F = xy + x'z$$

The function F expressed in sum of minterms is:

$$F(x,y,z) = \sum(1,3,6,7)$$

The missing terms are 0,2,4,5

Then, The function F expressed in product of maxterm is:

$$F(x,y,z) = \Pi(0,2,4,5)$$

# Integrated Circuits (ICs)

- Levels of Integration

## 1- Small-Scale Integration (SSI)

Number of gates are  $< 10$

## 2- Medium-Scale Integration (MSI)

Number of gates are from 10 to 1000

## 3- Large-Scale Integration (LSI)

contains thousands of gates in a single package

## 4- Very Large-Scale Integration (VLSI)

contains hundred of thousands of gates in a single package

# Digital Logic families

- Digital ICs are classified not only by their complexity or logical operations but also by the specific circuit technology to which they belong which is referred to as digital logic family.
- The basic circuits in each technology is a NAND, NOR, or inverter gate.
- The electronic components employed in the construction of the basic circuit are usually used to name the technology.

# Digital Logic families (*Contd.*)

- The most popular logic families are:

## 1- **TTL Transistor-Transistor Logic**

is being in operation for a long time and is a standard

## 2- **ECL Emitter-Coupled Logic**

has an advantages in systems requiring high speed operation

## 3- **MOS Metal-oxide Semiconductor**

suitable for circuits that need high component density

## 4- **CMOS Complementary Metal-oxide Semiconductor**

preferable in systems requiring low power consumption as in VLSI

# Digital Logic families parameters

- These are the parameters that are evaluated and compared for different families:
  - 1- **Fan-out**: the number of standard loads that the output of a gate can drive.
  - 2- **Fan-in**: the number of inputs available in the gate.
  - 3- **Power dissipation**: power consumed by the gate that must be available from the power supply.
  - 4- **Propagation delay**: average transition delay time for the signal to propagate from input to output.
  - 5- **Noise margin**: is the maximum external noise voltage added to an input signal that does not cause an undesirable change in the circuit output

# Computer-Aided Design (CAD)

- Software programs that support computer-based representation and aid in the development of digital hardware by automating the design process.
