

Abstract :

Towards building a social learning model for preventing drugs abuse in university institutions – Al majmaah University as a model -

This study aimed to present a suggested proposal about building a social educational model to prevent drugs abuse in university institutions. To achieve this, the researcher used the descriptive analytical method to determine the dimensions of the model and a questionnaire. In light of the data collection the form of the five dimensions, which are goals, pillars , mechanisms, constraints, treatment, and the ingredients the model, has been built.

To investigate these dimensions, a questionnaire has been applied on professors staff about (63), who worked on both of Education college and Science college in Zulfi city , at Al Majmaah University in Saudi Arabia, during the academic year 1432/ 1433H. They are differentiated in their scientific degrees as a professor, an associate professor, and assistant professor. They were selected randomly in a regular wa .

The most important results that the study has reached to are;

-This group of professors show strong agreement towards the social educational dimension of the model to prevent drug abuse(mean= 3.66).As a whole , the professors seemed to hold a positive attitude with a present (73.2%).

-The study sample responses to the aims which set for the model achieved a mean (4.5), so, it represented a high value which completely correspond to an "equivalent percentage" (90%). There was no statistically significant differences depending on the variable academic specialization and variable experience among the members of the study in the five dimensions (goals, pillars, mechanisms, constraints, the ingredients) which included in the model.
